Overview

This lab demonstrates Azure DocumentDB protocol support for MongoDB, which allows very easy migration of application using MongoDB to Azure DocumentDB. DocumentDB is powerful Azure PaaS NoSQL which offers some advantages compared with MongoDB. See more https://azure.microsoft.com/en-us/services/documentdb/

The lab consists of: * Spinning up DocumentDB PaaS service with MongoDB support, which is currently in Public Preview * Deploying Linux Ubuntu VM * Installing mongodb-org-shell package to Linux VM * Accessing Azure DocumentDB using mongo shell command line client * Optional part: Running a Java App with MongoDB driver connecting to Azure DocumentDB using MongoDB API

Pre-Requisites

- Access to Azure Portal with a right to deploy and use Azure services
- For optional part (Java Application with MongoDB driver), you need Java Development Environment with following or similar components installed:
- Java IDK
- OS running CentOS Linux release 7.2.1511 (Core) or similar

```
[radim@localhost mongodb-rci]$ java -version
openjdk version "1.8.0_102"
openJDK Runtime Environment (build 1.8.0_102-b14)
OpenJDK 64-Bit Server VM (build 25.102-b14, mixed mode)
```

Maven for Java project management

```
[radim@localhost mongodb-rci\]$ mvn --version
Apache Maven 3.0.5 (Red Hat 3.0.5-16)
Maven home: /usr/share/maven
Java version: 1.7.0\_111, vendor: Oracle Corporation
Java home: /usr/lib/jvm/java-1.7.0-openjdk-1.7.0.111-
2.6.7.2.el7\_2.x86\_64/jre
Default locale: en\_US, platform encoding: UTF-8
OS name: "linux", version: "3.10.0-327.36.1.el7.x86\_64", arch: "amd64",
family: "unix"
[radim@localhost mongodb-rci\]$
```

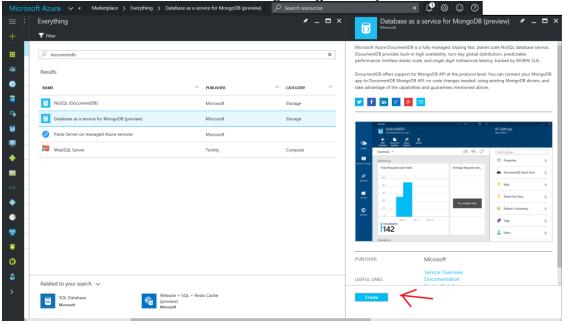

• Eclipse IDE for Java Developers, e.g. Neon.1a (4.6.1)

```
[radim@localhost Downloads\]$ ls ec\*
eclipse-java-neon-1a-linux-gtk-x86\_64.tar.gz
[radim@localhost Downloads\]$
```

Laboratory section(s)

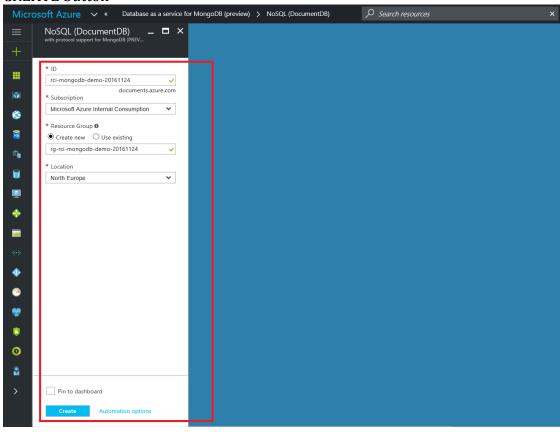

DocumentDB PaaS service deployment using Azure Portal

Provision Database as a service for MongoDB (preview) in Azure Portal

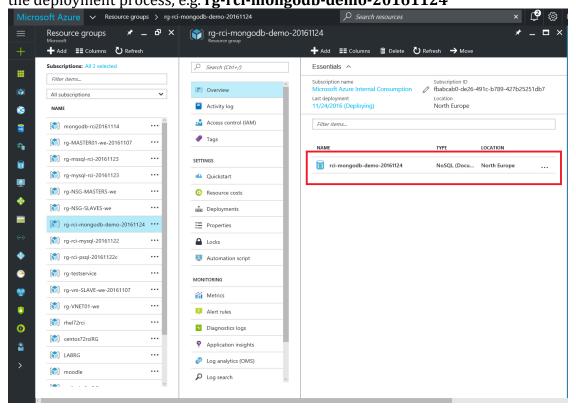

• Complete the provisioning process as suggested in the screenshot below. Make sure you use unique ID for your DocumentDB instance. DB deployment starts upon click on

CREATE button

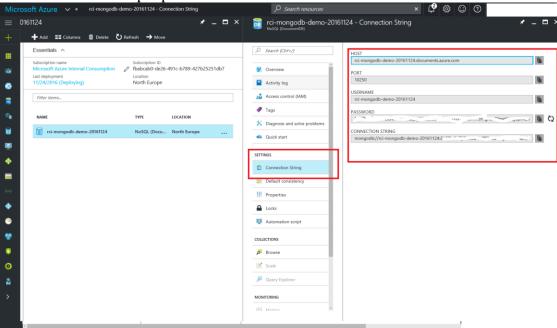

In Azure portal, navigate to specific Resource Group (RG) you have created as a part of the deployment process, e.g. **rg-rci-mongodb-demo-20161124**

As a part of this resource group, your DocumentDB instance should be deployed and visible in the overview section.

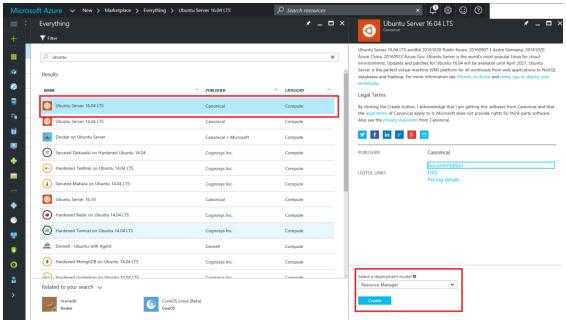

By click4 on the DB instance in the RG **Overview** section, you open the DB instance
ribbon, which gives you access to various DB PaaS options. Click on **Connection string**in order to open the form with connection parameters. Make sure you note all of them

down for this demo purposes.

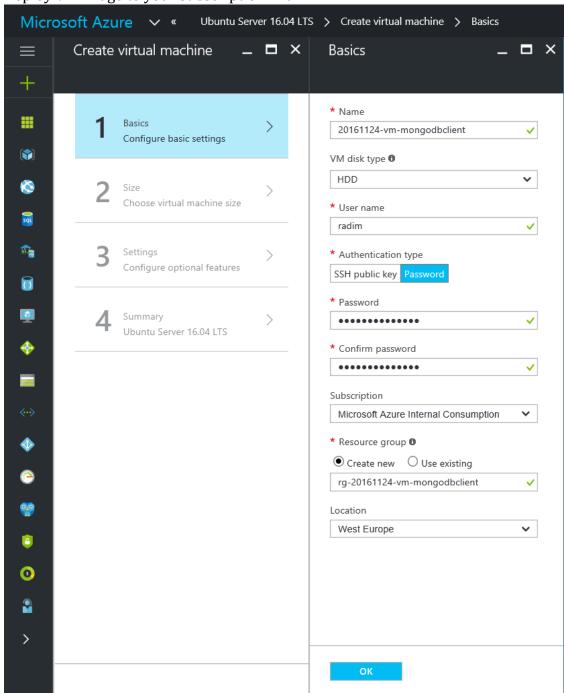

VM deployment with MongoDB client using Azure Portal

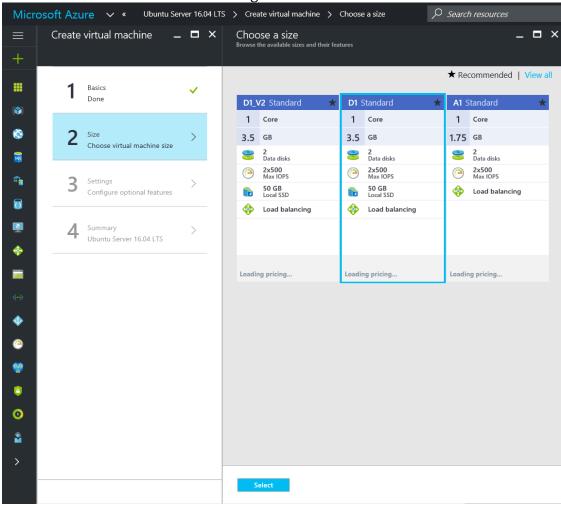

• From Azure Marketplace, deploy VM image by Canonical with Ubuntu 16.04 LTS Linux. There will be later installed mongo shell command line client which will be used in this demo.

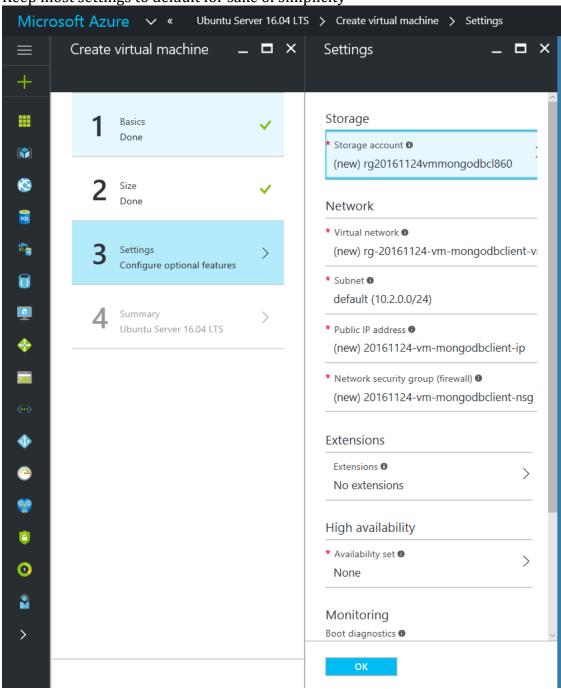

• Deploy VM image to your subscription with.

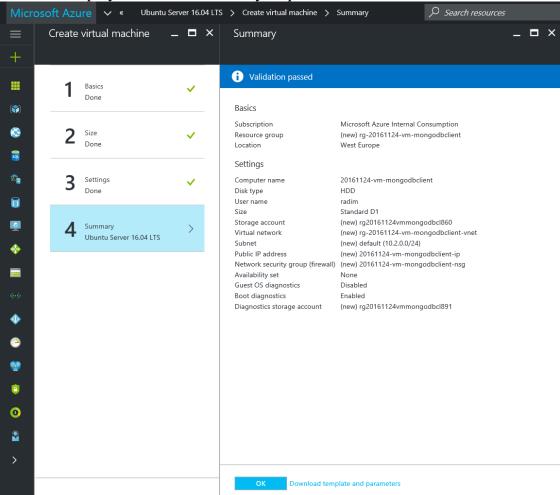

• Select the desired size of the VM image. Recommended VM Size is D1.

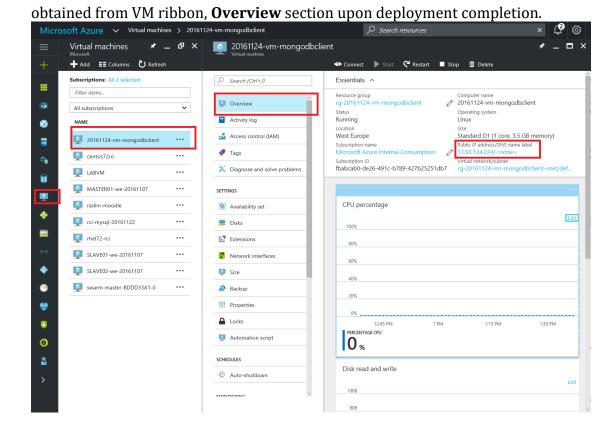

Keep most settings to default for sake of simplicity

Check the deployment in the Summary step and confirm

• Once VM with MongoDB app is deployed you may SSH to it using username and password you have provided in during provisioning process. IP address can be

Working to DocumentDB using Mongo command line client

- This section assumes:
- You have successfully deployed DocumentDB with MongoDB protocol interface support as explained in the previous section
- You have successfully deployed Linux VM Ubuntu 16.04 LTS by Canonical and you can SSH to this VM
- Next, SSH to your Ubuntu VM and run following commands in order to enable MongoDB package repository which will allow us MongoDB binaries. In the final step you deploy mongo shell command line.

```
$ sudo apt-key adv --keyserver hkp://keyserver.ubuntu.com:80 --recv
0C49F3730359A14518585931BC711F9BA15703C6
$ echo "deb http://repo.mongodb.org/apt/ubuntu xenial/mongodb-org/testing
multiverse" | sudo tee /etc/apt/sources.list.d/mongodb-org-3.4.list
$ sudo apt-get update
$ sudo apt-get install -y mongodb-org-shell
```

The whole procedure should generate following output:

```
[radim@localhost Downloads]$ ssh radim@13.93.124.224
The authenticity of host '13.93.124.224 (13.93.124.224)' can't be established.
ECDSA key fingerprint is 80:55:d5:02:4d:db:39:6b:5e:e7:6a:5c:8b:f1:23:ef. Are you sure you want to continue connecting (yes/no)? yes
```

```
Warning: Permanently added '13.93.124.224' (ECDSA) to the list of known
hosts.

Setting up mongodb-org-shell (3.4.0~rc5) ...
radim@20161124-vm-mongodbclient:~$
```

 In order to proceed, launch mongo command line client in your Linux VM and provide it with your DocumentDB instance connection parameters. Those have been captured in the previous section when deploying DocumentDB instance. It should look similar to this:

```
radim@20161124-vm-mongodbclient:~$ mongo --host rci-mongodb-demo-
20161124.documents.azure.com --port 10250 -u rci-mongodb-demo-20161124 --
ssl -p
MongoDB shell version v3.4.0-rc5
Enter password:
connecting to: mongodb://rci-mongodb-demo-
20161124.documents.azure.com:10250/
MongoDB server version: 3.2.0
WARNING: shell and server versions do not match
Welcome to the MongoDB shell.
For interactive help, type "help".
For more comprehensive documentation, see
    http://docs.mongodb.org/
Questions? Try the support group
    http://groups.google.com/group/mongodb-user
>
```

• Let's insert and inspect some data in your DocumentDB like it was any other MongoDB using mongo command line shell:

```
radim@20161124-vm-mongodbclient:~$ mongo --host rci-mongodb-demo-
20161124.documents.azure.com --port 10250 -u rci-mongodb-demo-20161124 --ssl
-p
MongoDB shell version v3.4.0-rc5
```

```
Enter password:
connecting to: mongodb://rci-mongodb-demo-20161124.documents.azure.com:10250/
MongoDB server version: 3.2.0
WARNING: shell and server versions do not match
Welcome to the MongoDB shell.
For interactive help, type "help".
For more comprehensive documentation, see
        http://docs.mongodb.org/
Questions? Try the support group
        http://groups.google.com/group/mongodb-user
> show dbs
admin 0.000GB
>
> use radim database
switched to db radim_database
> db.getName()
radim database
> db.tennisplayers.insert( { _id: "00001", firstname: "Serena", lastname:
"Williams", ATPrank: "2", birtdate: "26/09/1981"})
WriteResult({ "nInserted" : 1 })
> db.tennisplayers.insert( { id: "00002", firstname: "Novak", lastname:

>
```

And that's the final step of the basic lab part. If you have suitable Java environment as defined in Pre-Requisites section, you can proceed with the optional part.

Optional part: Running Java App with MongoDB driver against Azure DocumentDB instance

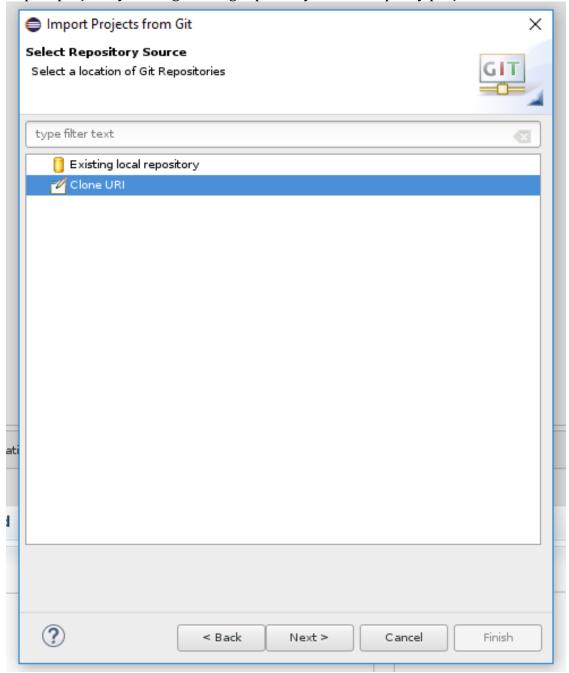

This is part is considered to be advanced and requires some knowledge of Eclipse IDE, Java Application development and basic knowledge how to use GitHub repository.

• In your local Java Application Development environment as specified in the Pre-Requisites chapter, use the Eclipse Import Project to fetch the project sources from GitHub repository https://github.com/Microsoft-OpenSource-Labs/azure-mongodbjavaapp-demo.git.

• Start with menu File Import and proceed further.

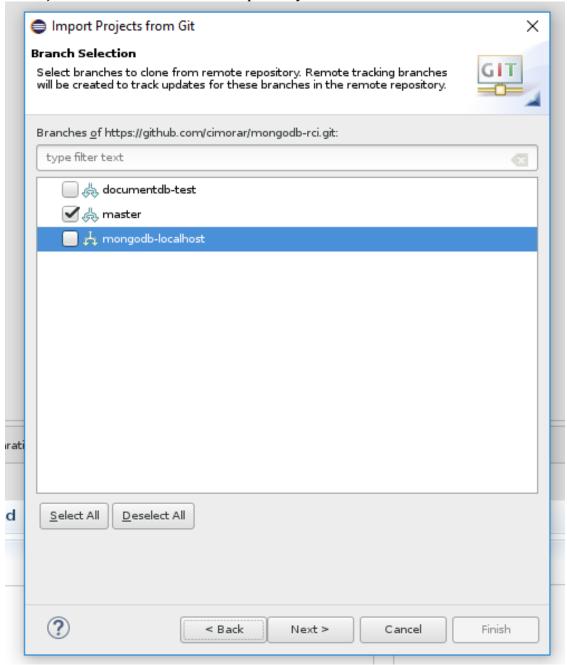

• Import project by cloning existing repository. You will specify project URI later.

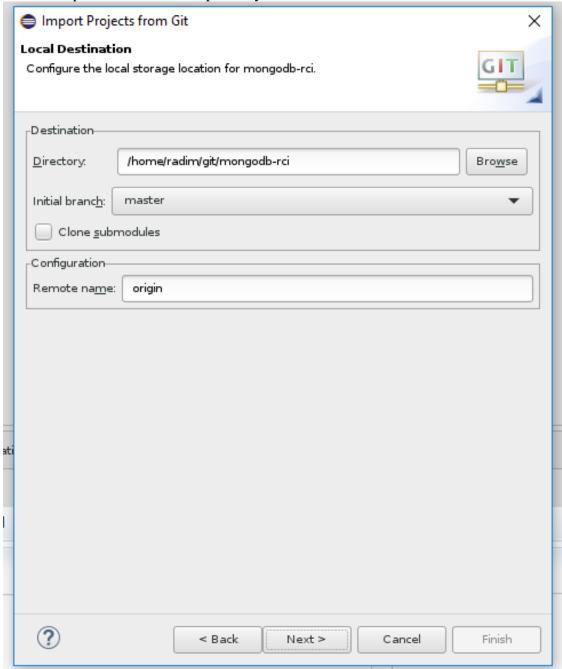

• Enter the URI of this repository and provide connection and authentication params.

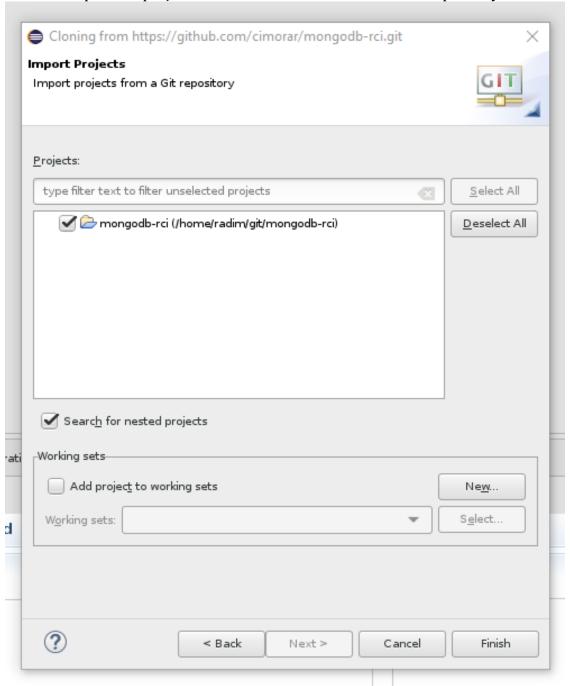

• Clone just a master branch of the repository.

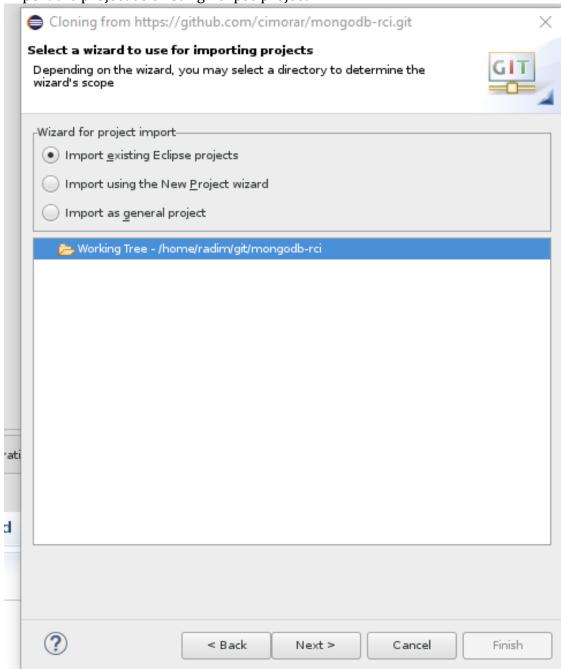

• Select the path for the local repository clone.

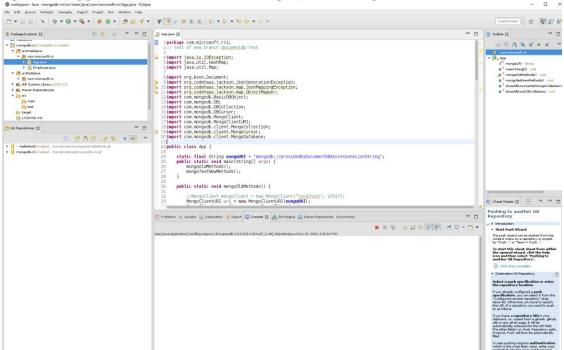

• Select to import the project which was detected in the remote repository.

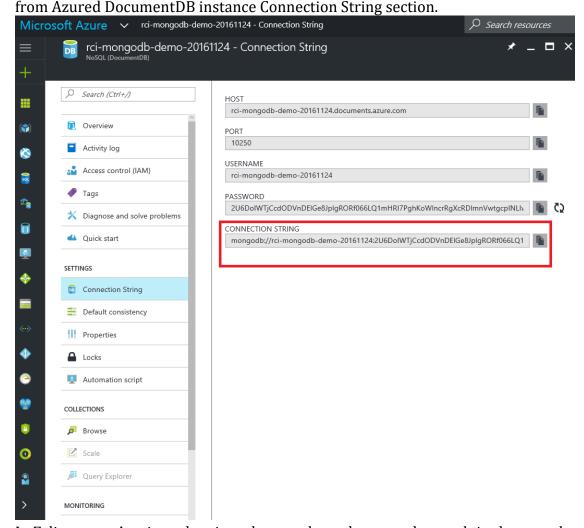

• Import the project as existing Eclipse project.

• Open the App.java source code from the project workspace.

• Adjust the App.java source code by inserting the proper connection string to *mongoURI* string final object in App.java class. The connection string can be obtained

• In Eclipse, run App.java class in order test the code to see the result in the console output.

Conclusion

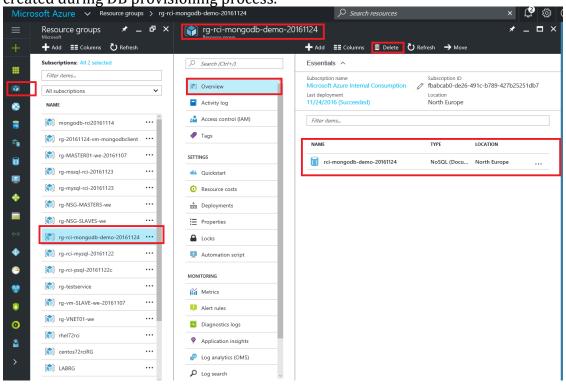

- This lab demonstrated simple use of Azure DocumentDB with MongoDB protocol support, which allows to use MongoDB API towards Azure PaaS NoSQL DocumentDB database like it was true MongoDB. We have deployed Azure PaaS NoSQL DocumentDB database and then Linux Ubuntu VM to run mongo command line shell which acted as DB client.
- In the optional part, simple Java application connects to Azure DocumentDB using standard mongodb driver and executes basic database operations.

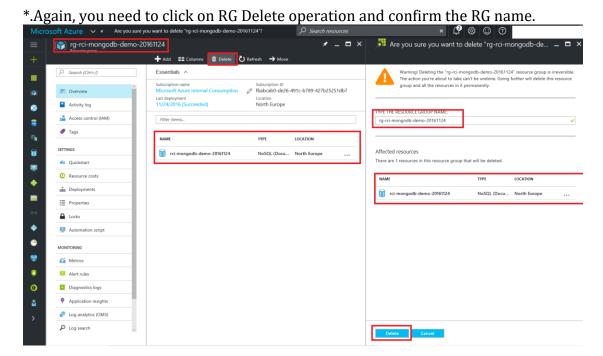

End your Lab

 Once this lab is completed, please make sure you delete all resources which are used to host you Linux VM and PaaS DB service in order to avoid unnecessary service charges.

- The easiest way to accomplish this is by removal of all resource groups which were created during provisioning process in order to keep the associated resources.
- In case of VM, please remove the entire Resource Group you have created for it, e.g. **rg-20161124-vm-mongodbclient** *.You need to click on RG Delete operation and confirm the RG name.

• In case of Azure DocumentDB PaaS service, proceed as following in order to delete the associated Resource Group, e.g. **rg-rci-mongodb-demo-20161124**, which was created during DB provisioning process.

• For optional part of the lab, Java Application connecting to DocumentDB, please remove and delete the project repository from your local workspace if needed.
